A list stores multiple values in one variable. ← **list**

grocery[0]

grocery = ["Biscuits", "Bread", "Cereals", "Butter"]

grocery[1] grocery[2] grocery[3]

print (grocery)

O/p → ["biscuit", "Bread" ...]

print (grocery [0]) ⇒ O/p → Biscuits.

print (grocery [1]) ⇒ O/p → Bread

Means creating a list using list() function instead of square brackets.

← list constructor

↓

automatically runs when object is created

✓ fruits = ["apple", "banana"] ✓

Method 2

✓ fruits = list(("apple", "banana"))

print fruits

O/P ["apple", "banana"]

Constructor

Building a House

- Class → House design (Blueprint)
- Object → Actual house
- Constructor → workers preparing the house when it is build.
